WINDOW WELL COVER "CORNER TEMPLATE" What SHAPE Is Your Window Well?

Measuring Instructions

1. Visually check the shape of your window well and choose the shape that matches. The template will assist to determine the correct model shape.
2. Measure the width and depth of the well opening to the outer edges. Window well covers are often larger than the actual well opening. Do not be concerned if they overhang, for an overlap fit.

Please write your measurements here. _____ Width x _____ Depth | Shape _____

Useful Tips:

1. Shape Products' model numbers indicate the actual dimension of the cover.
Example: 6238RM = 62" W X 38"D Rectangular.
2. Often window wells are slightly larger (or smaller) than the closest sized WW cover. The width or depth can be adjusted by tapping the top edge of the window well with a sledge hammer and block of wood to achieve the desired dimension and fit.
3. In extreme cases, window wells are not symmetrical and out of shape. This is the result of careless installation and backfilling technique. Digging along the foundation will expose the bolted flange. The well can be re-shaped by aligning the well to the desired shape or dimension and fastening back to the foundation. Removing sod and soil around the perimeter of the well will make this task easier.

UMB=Heavy Arched

UM=U-Shape

RM=Rectangular

Place Template Along The
Front & Right Edge Of Window
Well To Determine The Best
Possible Fit.
